

If you're unfamiliar with React, you most likely want to understand how to present a list of things in the JSX syntax of React. You can explore how to render a list of straightforward primitives, a list of complicated entities, and how to modify the context of your list in React is simply used in below code of line 46 as at line 46 unordered list is being created for onClickHandler, text, index, isSelected. The below code contains the pieces of list component.

```
onClickHandler={() => handleClick(index)}  
  text={item.text}  
  index={index}  
  isSelected={selectedIndex}
```
